  - Interfaces for inter-language communication

# What is Cactus?

Cactus is

- a framework for developing portable, modular applications solving 3D PDE time evolutions

# What is Cactus?

Cactus is

- a framework for developing portable, modular applications solving 3D PDE time evolutions
- focusing, although not exclusively, on high-performance simulation codes

# What is Cactus?

Cactus is

- a framework for developing portable, modular applications solving 3D PDE time evolutions
- focusing, although not exclusively, on high-performance simulation codes
- designed to allow experts in different fields to develop modules based upon their experience and to use modules developed by experts in other fields with minimal knowledge of the internals or operation of the other modules

# Cactus Goals

- Portable
  - Different development machines
  - Different production machines

# Cactus Goals

- Portable
  - Different development machines
  - Different production machines
- Modular
  - Standard interfaces for module interaction for easier code interaction, writing and debugging
  - Interchangeable modules with same functionality

# Cactus Goals

- Portable
  - Different development machines
  - Different production machines
- Modular
  - Standard interfaces for module interaction for easier code interaction, writing and debugging
  - Interchangeable modules with same functionality
- Easy to use
  - Good documentation
  - Try to let users program the way they are used to
  - Support all major programming languages

# Philosophy

- Open code base to encourage community contributions
- Strict quality control for base framework
- Development always driven by real user requirements
- Support and develop for a wide range of application domains

# Cactus History

- Direct descendant of many years of code development in Ed Seidel's group of researchers at NCSA
- 1995, Paul Walker, Joan Masso, Ed Seidel, and John Shalf: Cactus 1.0
- Originally for numerical relativity
- Over the years generalized for use by scientists in other domains

# Current Users and Developers

# Community

- Web: <http://www.cactuscode.org/>
- Email lists
  - [users@cactuscode.org](mailto:users@cactuscode.org)
  - [developers@cactuscode.org](mailto:developers@cactuscode.org)
- Download: Subversion (<https://svn.cactuscode.org/>)
- Bug tracker

# Covers

# Cactus Funding

- Organizations:

- Max-Planck-Gesellschaft
- Center for Computation & Technology at LSU
- National Center for Supercomputing Applications
- Lawrence Berkeley National Laboratory
- Washington University
- University of Tübingen

- Grants:

- NSF (PHY-9979985, 0540374, 0653303, 0701491, 0701566)
- Europ. Commission (HPRN-CT-2000-00137, IST-2001-32133)
- DFN-Verein (TK 6-2-AN 200)
- DFG (TiKSL)
- ONR (COMI)
- DOE/BOR (OE DE-FG02-04ER46136, BOR DOE/LEQSF)

# The Cactus Computational Toolkit

Core modules (thorns) providing many basic utilities:

- I/O methods
- Boundary conditions
- Parallel unigrid driver
- Reduction and Interpolation operators
- Interface to external elliptic solvers
- Web-based interaction and monitoring interface
- Simple example thorns (wavetoy)

# Many arrangements with many modules...

CactusBase	Basic utility and interface thorns
CactusBench	Benchmark utility thorns
CactusConnect	Network utility thorns
CactusElliptic	Elliptic solvers / interface thorns
CactusExamples	Example thorns
CactusExternal	External library interface thorns
CactusIO	General I/O thorns
CactusNumerical	General numerical methods
CactusPUGH	Cactus Unigrid Driver thorn
CactusPUGHIO	I/O thorns specific for PUGH driver
CactusTest	Thorns for Cactus testing
CactusUtils	Misc. utility thorns
CactusWave	Wave example thorns

# I/O Capabilities

Usual I/O and checkpointing in different formats:

- Screen output
- ASCII file output
- HDF5 file in-/output
- Online Jpeg rendering
- Online VisIt visualization

# More Capabilities: Grids, Boundaries, Symmetries

- Grids

- Only structured meshes (at the moment)
- Unigrid (PUGH)
- Adaptive Mesh Refinement (Carpet)

- Boundaries / Symmetries

- Periodic
- Static
- Mirror symmetries
- Rotational symmetries
- Problemspecific boundaries

# Visualization

Visualization is important, because

- can give essential insight into dynamics
- can detect errors much better than just looking at numbers
- necessary for publications
- can be good advertisement (cover pages ...)

Different visualization types:

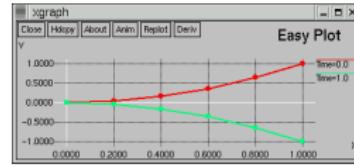

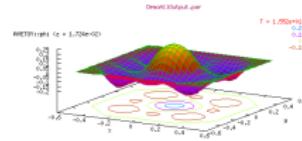

- 1D/2D: most of published pictures
- 3D: usually done for movies

# Visualization Clients

- Output can be visualized by many clients, e.g.:

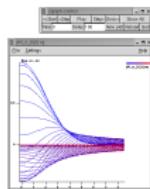

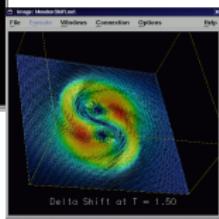

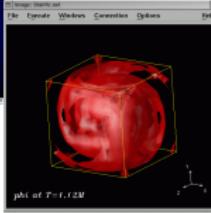

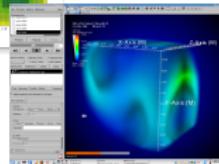

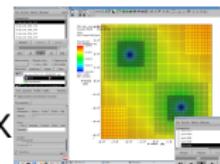

- 1D/2D

- gnuplot
- xgraph
- ygraph

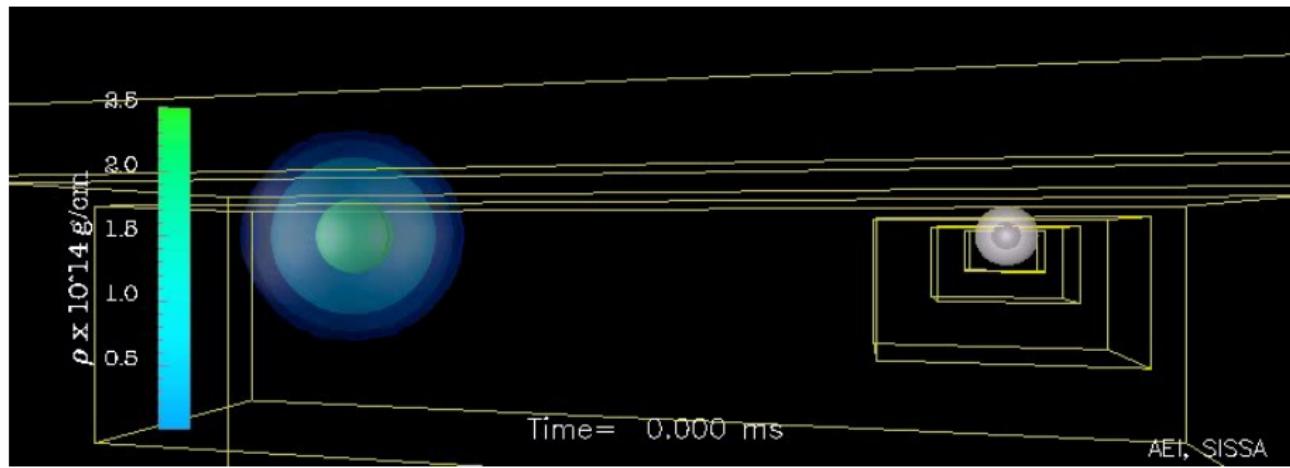

- 3D

- VisIt
- OpenDX
- Amira

# Example Movie I

Merger of neutron star and black hole

# Example Movie II

Binary black hole inspiral, merger and ringdown

# Cactus Structure

# Framework - no prebuild executable

## Cactus

- does not provide executable files
- provides infrastructure to create executables

## Why?

- Problemspecific code not part of Cactus
- System libraries different on different systems
- Cactus is free software, but often problemspecific codes are not → non-distributable binary

# Structure Overview

Two fundamental parts:

- The Flesh
  - The core part of Cactus
  - Independent of other parts of Cactus
  - Acts as utility and service library

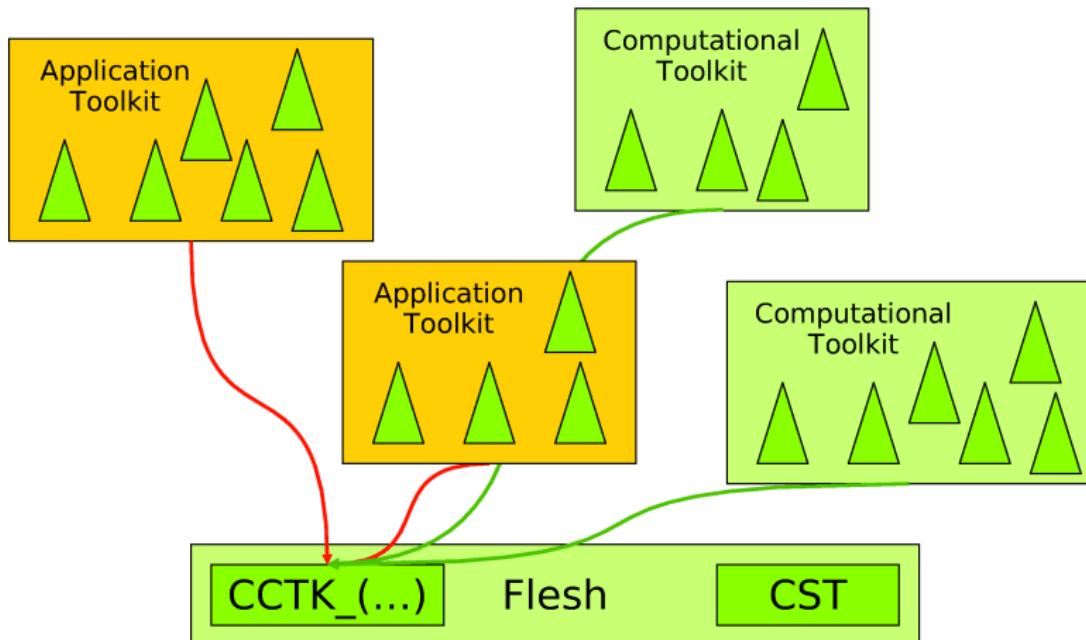

# Structure Overview

Two fundamental parts:

- The Flesh
  - The core part of Cactus
  - Independent of other parts of Cactus
  - Acts as utility and service library
- The Thorns
  - Separate libraries (modules) which encapsulate the implementation of some functionality
  - Can specify dependencies on other implementations

# Application View

The structure of an application that is built upon the Cactus computational framework

# Download 'GetComponents'

The screenshot shows the Cactus Code website's download page. At the top, there's a navigation bar with links for Home, Contact, About, Media, Demo, Download (which is underlined), Documentation, Community, and Internal. Below the navigation is a breadcrumb trail: > home → download. The main content area has a blue header "Download Cactus". Underneath, there are two sections: "License" and "Getting the Code". The "License" section explains that the Cactus Code is Copyrighted by individual Authors and distributed under the GNU Lesser General Public License. The "Getting the Code" section states that Cactus is maintained using Subversion, and it's recommended to use the GetComponents script along with a thornlist. A note says to save the checkout script with the name GetComponents and make it executable. To the right, there's a sidebar with a Google Custom Search bar and a list of download-related links: Configuration Files, Release Notes, Thorn Lists, and WaveToy Demo.

## Download Cactus

### License

The Cactus Code is (C) Copyrighted by the individual Authors and distributed under the [GNU Lesser General Public License](#). Most of the computational packages that come with it follow this license, but the authors of any thorn are free to follow any licensing they deem appropriate as long as they state it explicitly in their thorn distribution.

### Getting the Code

Cactus is maintained using [Subversion](#). The preferred method is to use the GetComponents script along with a thornlist as described below. We maintain a [page of basic thornlists](#), or you can use your own customized thornlist.

Save the [checkout script](#) with the name GetComponents and make it executable.

Google Custom Search search

### Download

- [WaveToy Demo](#)

<http://www.cactuscode.org/download/GetComponents>

# Download Thornlist

The screenshot shows the Cactus Code website's download section. At the top, there's a navigation bar with links for Home, Contact, About, Media, Demo, Download (which is underlined), Documentation, Community, and Internal. Below the navigation is a breadcrumb trail: > home → download → thorns. The main content area has a title "Thorn Lists". It contains text about thorn lists being a convenient way for choosing a configuration of Cactus for checkout and compilation, noting that development version thorn lists may differ. It also mentions the Management-HOWTO and the MakeThornList script. Further down, it links to the ComputationalToolKit-HOWTO. A sidebar on the right is titled "Recent News" and lists several items: "Whisky Retreat V" (7 November 2009), "Webcast: From Black Holes to Gamma-Ray Bursts, hosted by SiCortex" (17 March 2009), and "Cactus 4.0 beta 16 released" (3 February 2009). The date "2 December 2008" is also visible.

> home → download → thorns

## Thorn Lists

The thorn lists below provide a convenient way for choosing a configuration of Cactus for checkout and compilation. More thorn lists will be added as applications and examples are developed. Note that thorn lists for the development version of Cactus may be slightly different.

For information on using a ThornList for checking out thorns, please see the [Management-HOWTO](#). The [MakeThornList](#) script can be used to generate a ThornList for a specific parameter file.

For more information about individual thorns, check the [ComputationalToolKit-HOWTO](#).

## Computational Infrastructure

The computational infrastructure thorns are designed to provide the basic utilities for any simulation, such as IO, reductions, and driver thorns.

# Configuring Cactus

- Cactus knows about a lot of default system configurations
- However: often system specific configuration needed
- Example config file:

```
CC   = /usr/local/compilers/intel_cce_11.0.074.x86_64/bin/intel64/icc
CXX  = /usr/local/compilers/intel_cce_11.0.074.x86_64/bin/intel64/icpc
F77  = /usr/local/compilers/intel_fce_11.0.074.x86_64/bin/intel64/ifort
F90  = /usr/local/compilers/intel_fce_11.0.074.x86_64/bin/intel64/ifort

CPPFLAGS = -openmp -DMPICH_IGNORE_CXX_SEEK
FPPFLAGS = -fopenmp -traditional
CFLAGS   = -openmp -g -debug all -align -std=c99 -U__STRICT_ANSI__
CXXFLAGS = -openmp -g -debug all -align -std=c++0x -restrict -D__builtin_isnan=:isnan
F77FLAGS = -openmp -g -debug all -align -pad -traceback -w95 -cm
F90FLAGS = -openmp -g -debug all -align -pad -traceback -w95 -cm

DEBUG      = yes
OPTIMISE   = yes
WARN       = yes

MPI        = MPICH
MPICH_DIR  = /usr/local/packages/numrel/mpich-1.2.7p1

HDF5       = yes
HDF5_DIR   = /usr/local/packages/numrel/hdf5-1.8.0
```

# Creating a Configuration

- Configurations consist of
  - a particular list of thorns
  - particular configuration options

- Creating configuration:

```
make <NAME>-config
```

- New source tree: '-- Cactus

```
:  
|-- Makefile  
|-- arrangements ...  
|-- doc  
|-- lib  
|-- src  
'-- configs  
    '-- NAME
```

# Building and Running a Cactus binary

- Building new configuration:

```
make <NAME>
```

- Executable in Cactus/exe subdirectory

```
'-- Cactus
  :
  |-- doc
  |-- lib
  |-- src
  |-- configs ...
  '-- exe
    |-- cactus_HelloWorld
    '-- cactus_wavetoy
```

- Execute Syntax: <executable> [options] <parameter file>
- Example: ./exe/cactus\_HelloWorld HelloWorld.par

# Cactus Structure The Flesh

# The Flesh

- Make system
  - Organizes builds as 'configurations'
  - Can build various documentation documents
  - Can update Cactus flesh and thorns
- Scheduling: Sophisticated scheduler which calls thorn-provided functions as and when needed
- API: Interface for functions to be callable from one thorn by another
- CCL: Configuration language which describes necessary details about thorns to the flesh

# Cactus Structure The Thorns

# The Driver

- Special thorn
- Only one active for a run, choose at starttime
- The only code (almost) dealing with parallelism
- Other thorns access parallelism via API
- Underlying parallel layer transparent to application thorns
- Examples
  - PUGH: unigrid, part of the Cactus computational toolkit
  - Carpet: mesh refinement, <http://www.carpetcode.org>

# Grid functions

Cactus provides methods to

- Distribute variables across processes (grid function)
- Synchronize processor domain boundaries between processes
- Compute reductions across grid functions
- Actual implementation in driver thorn

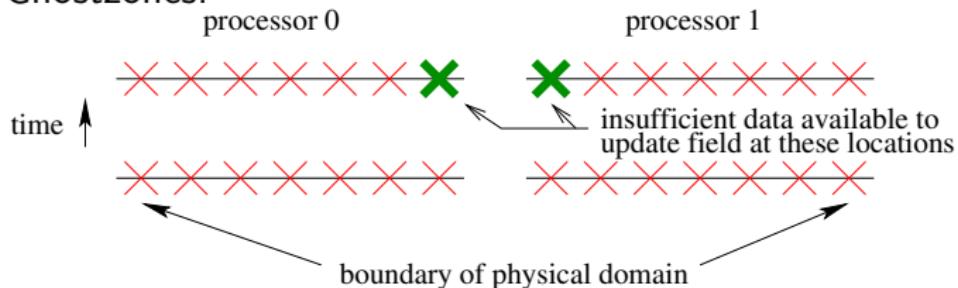

# Ghost zones

- Grid variables: distributed across processes
- Assumption: Most work done (quasi-) locally:  
True for hyperbolic and parabolic problems
- Split of computational domain into blocks
- Only communication at the borders (faces)
- At least stencil size many ghostzones

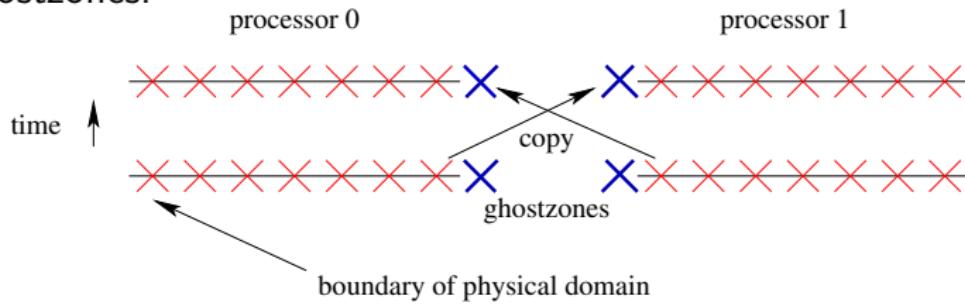

# Ghost zone example

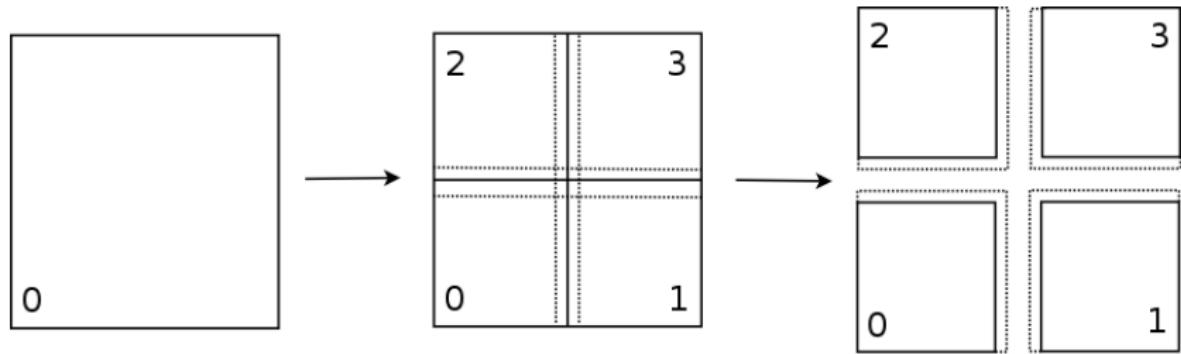

Without Ghostzones:

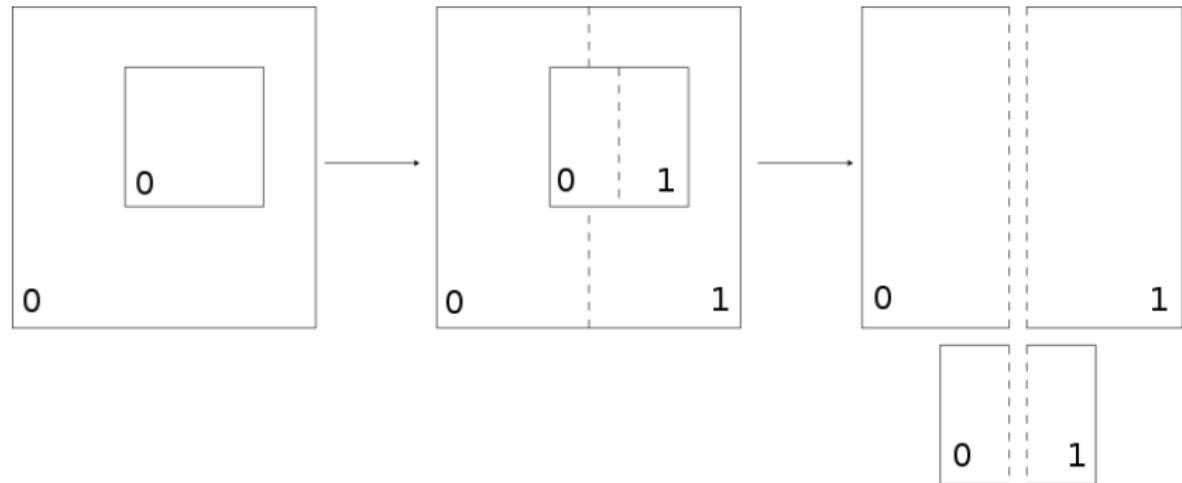

With Ghostzones:

# Domain decomposition

# Mesh refinement decomposition

# Arrangements

- Group of thorns
- Organizational convenience
- Something in common:
  - Related functionality
  - Same author(s), research group
- Toolkit: Collection of Arrangements

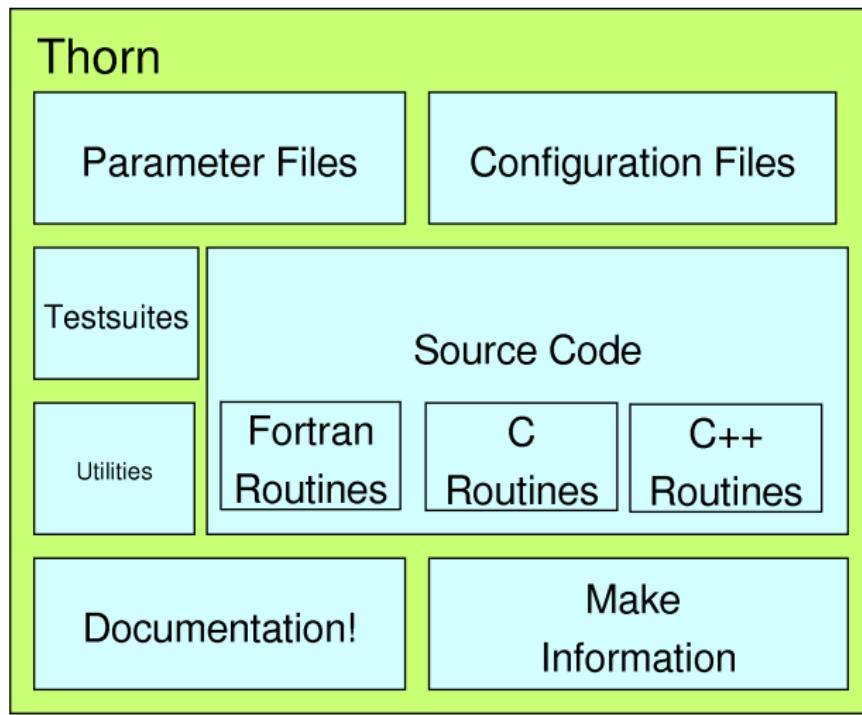

Directory structure:

```
Cactus
  '-- arrangements
      '-- Arrangement-A
          |   '-- Thorn-A1
          |   '-- Thorn-A2
      '-- Arrangement-B
          |   '-- Thorn-B1
          |   '-- Thorn-B2
```

# Thorn Structure

Inside view of a plug-in module, or thorn for Cactus

# Thorn Structure

Directory structure:

```
Cactus

# Thorn Specification

Three configuration files per thorn:

- `interface.ccl` declares:
  - an 'implementation' name
  - inheritance relationships between thorns
  - Thorn variables
  - Global functions, both provided and used

# Thorn Specification

Three configuration files per thorn:

- `interface.ccl` declares:
  - an 'implementation' name
  - inheritance relationships between thorns
  - Thorn variables
  - Global functions, both provided and used
- `schedule.ccl` declares:
  - When the flesh should schedule which functions
  - When which variables should be allocated/freed
  - Which variables should be synchronized when

# Thorn Specification

Three configuration files per thorn:

- `interface.ccl` declares:

- an 'implementation' name
- inheritance relationships between thorns
- Thorn variables
- Global functions, both provided and used

- `schedule.ccl` declares:

- When the flesh should schedule which functions
- When which variables should be allocated/freed
- Which variables should be synchronized when

- `param.ccl` declares:

- Runtime parameters for the thorn
- Use/extension of parameters of other thorns

# interface.ccl

## Variables:

- Flesh needs to know about thorn variables for which it has to care about allocation, parallelism, inter-thorn use
- Scopes: public, private
- Many different basic types (double, integer, string, ...)
- Different 'group types' (grid functions, grid arrays, scalars, ...)
- Different 'tags' (not to be checkpointed, vector types, ...)

# Syntax of interface.ccl

IMPLEMENTS: <interface name>

INHERITS: <interface name> ...

[PUBLIC:|PRIVATE:]

[REAL|COMPLEX|INT] <group name> TYPE=[gf|array]

TIMELEVELS=<number> [DIM=... SIZE=...]

{

<variable name>

...

} <description>

## Syntax of interface.ccl cont.

```
[REAL|COMPLEX|INT|POINTER] FUNCTION <function name> (
    [REAL|COMPLEX|INT|STRING|POINTER] \
        [ARRAY] [IN|OUT] <argument name>,
    ...
)
```

```
[USES|REQUIRES] FUNCTION <function name>
```

```
PROVIDES FUNCTION <function name>
    WITH <implementation name> LANG [C|FORTRAN]
```

# Example interface.ccl

IMPLEMENTS: wavetoy

INHERITS: grid

PUBLIC:

```
REAL scalarevolve TYPE=gf TIMELEVELS=3
{
    phi
} "The evolved scalar field"
```

## Example interface.ccl cont.

```
CCTK_INT FUNCTION Boundary_SelectVarForBC (
    CCTK_POINTER_TO_CONST IN cctkGH,
    CCTK_INT IN faces,
    CCTK_INT IN boundary_width,
    CCTK_INT IN options_handle,
    CCTK_STRING IN var_name,
    CCTK_STRING IN bc_name
)
```

```
REQUIRES FUNCTION Boundary_SelectVarForBC
```

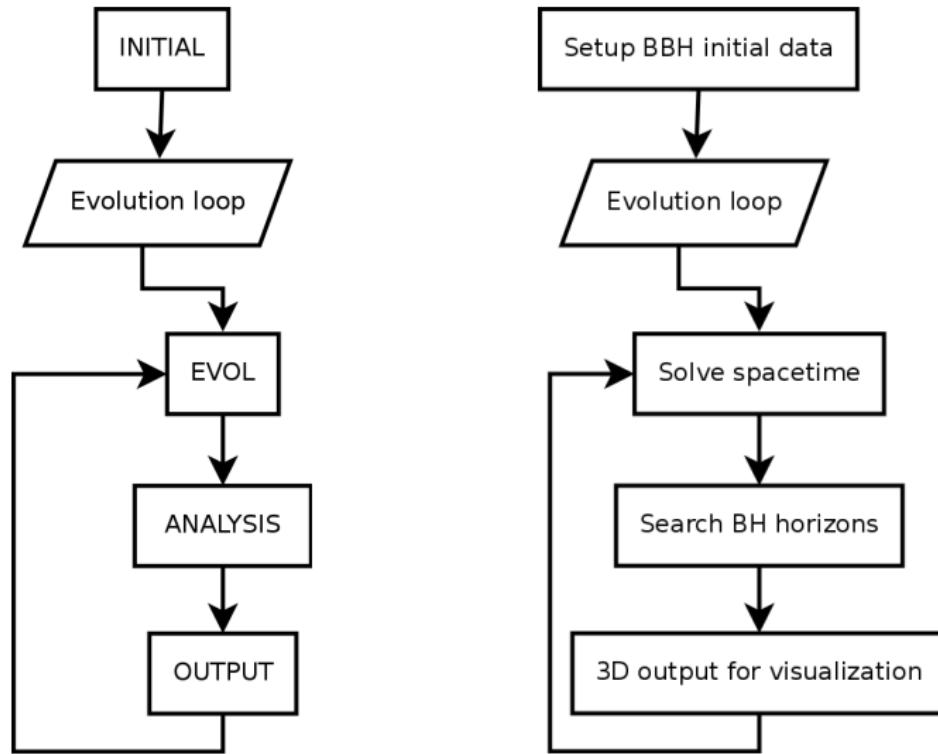

## schedule.ccl

- Flesh contains a flexible rule based scheduler
- Order is prescribed in schedule.ccl
- Scheduler also handles when variables are allocated, freed or synchronized between parallel processes
- Functions or groups of functions can be
  - grouped and whole group scheduled
  - scheduled before or after each other
  - scheduled depending on parameters
  - scheduled while some condition is true
- Flesh scheduler sorts all rules and flags an error for inconsistent schedule requests.

## schedule.ccl cont.

- Hierarchy: using schedule groups leads to a *schedule tree*
- Execution order: can schedule BEFORE or AFTER other items
  - e.g.: take time step after calculating RHS
- Loops: can schedule WHILE a condition is true
  - e.g.: loop while error is too large
- Conditions: can schedule if a parameter is set
  - e.g.: choose between boundary conditions
- Perform analysis at run time: TRIGGERS statements: call routine only if result is needed for I/O

# Example scheduling tree

# Syntax of schedule.ccl

```
SCHEDULE <function name> [AT <schedule bin>|  
                           IN <schedule group>]  
{  
    LANG: [C|Fortran]  
    SYNC: <group name> ...  
} <description>  
  
SCHEDULE GROUP <name> [AT <schedule bin>|  
                           IN <schedule group>]  
{  
} <description>  
  
STORAGE: <group name>[timelevels] ...
```

## Example schedule.ccl

```
SCHEDULE WaveToyC_Evolution AT evol
{
    LANG: C
} "Evolution of 3D wave equation"

SCHEDULE GROUP WaveToy_Boundaries AT evol \
           AFTER WaveToyC_Evolution
{
} "Boundaries of 3D wave equation"

STORAGE: scalarevolve[3]
```

# param.ccl

- Definition of parameters
- Scopes: Global, Restricted, Private
- Thorns can use and extend each others parameters
- Different types (double, integer, string, keyword, . . . )
- Range checking and validation
- Steerability at runtime

## Syntax of param.ccl

[SHARES: <implementation>]

[PUBLIC: | RESTRICTED: | PRIVATE:]

[BOOLEAN | KEYWORD | INT | REAL | STRING]

    <parameter name> <description> [STEERABLE=...]

{

    <allowed value> :: <description>

    <lower bound>:<upper bound> :: <description>

    <pattern> :: <description>

    ...

} <default value>

## Example param.ccl

SHARES: grid

USES KEYWORD type

PRIVATE:

KEYWORD initial\_data "Type of initial data"

{

    "plane"      :: "Plane wave"

    "gaussian"  :: "Gaussian wave"

} "gaussian"

REAL radius "The radius of the gaussian wave"

{

    0:\*  :: "Positive"

} 0.0

# Examples

# Hello World, Standalone

Standalone in C:

```
#include <stdio.h>
int main(void)
{
    printf("Hello World!\n");
    return 0;
}
```

# Hello World Thorn

# WaveToy Thorn: Wave Equation

For a given source function  $S(x, y, z, t)$  find a scalar wave field  $\varphi(x, y, z, t)$  inside the domain  $\mathcal{D}$  with a boundary condition:

- inside  $\mathcal{D}$ :

$$\frac{\partial^2 \varphi}{\partial t^2} = c^2 \Delta \varphi + S$$

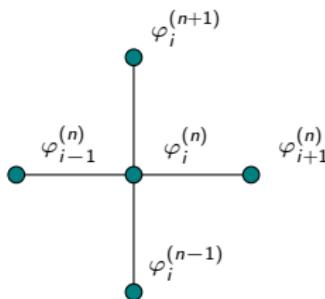

- on the boundary  $\partial\mathcal{D}$ :

$$\varphi|_{\partial\mathcal{D}} = \varphi(t=0)$$

# WaveToy Thorn: Discretization

Discretization:

approximating continuous function  $\varphi(x, t)$  with a grid function  $\varphi_i^{(n)}$ :

$$\frac{\partial^2 \varphi}{\partial t^2} = c^2 (\partial_x^2 \varphi) + S$$

$$\Downarrow (c \equiv 1)$$

$$\frac{\varphi_i^{(n+1)} - 2\varphi_i^{(n)} + \varphi_i^{(n-1)}}{2\Delta t^2} = \frac{\varphi_{i+1}^{(n)} - 2\varphi_i^{(n)} + \varphi_{i-1}^{(n)}}{2\Delta x^2} + S_i^{(n)}$$

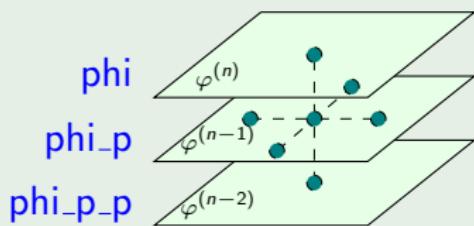

# WaveToy Thorn

Thorn structure:

## interface.ccl

- grid function `phi[3]`:

# WaveToy Thorn: Algorithm Illustration

Grid structure  
GF allocation

Set up coords  
Compute  $\Delta t$   
Initial data

Rotate timelevels  
Evolve GF, sync  
Apply BCs  
Output data

iohdf5::out_vars   = "grid::coordinates{out_every=10000000} wavetoy_simple::phi"
```

# Summary

- Cactus is a powerful framework for developing portable applications, particularly suited to large collaboration.
- Cactus is currently used by many groups around the world, in several fields.
- For more information: <http://www.cactuscode.org>, Users' guide (available online, also distributed with Cactus)

# Thanks

Thanks goes to

- All funding for Cactus
- LSU for support at CCT
- Cactus community...

The End

The End

# What is a framework?

A framework is

- a reusable design of all or part of a system that is represented by a set of abstract classes and the way their instances interact

# What is a framework?

A framework is

- a reusable design of all or part of a system that is represented by a set of abstract classes and the way their instances interact
- the skeleton of an application that can be customized by an application developer

# What is a framework?

A framework is

- a reusable design of all or part of a system that is represented by a set of abstract classes and the way their instances interact
- the skeleton of an application that can be customized by an application developer
- an architecture, implementation and documentation that captures the intended use of the framework for building applications
